

NEW FEATURE

WINDOW, COLUMN SIZE, AND TAB POSITION USER PREFERENCES

These new features have been created to allow users the ability to personalize the window size, window location, column widths and preferred tabular displays in the Rome program. As computer displays have changed in size and complexity these features provide greater flexibility in the user experience.

Here are examples of the Windows sizing arrows:

-  The Windows horizontal sizing arrow.
-  The Windows vertical sizing arrow.
-  The Windows diagonal sizing arrow.

WINDOW SIZE:

Each primary window displayed in Rome allows the users to adjust the window screen size to their personal preference. The program then remembers this preference and will restore the preferred view upon window closure and when the user logs in next. See **figure 1** below for the default login view and then see **Figure 2** for a customized view. In Figure 2, the main program screen was made slightly larger on the desktop and then the “Recent RO” list was also made slightly larger. To change the window size, simply “hover” the mouse pointer over a vertical, horizontal, or corner of the window edge until a split arrow icon appears and then click/hold, move and then unclick when the window is sized to your preference.

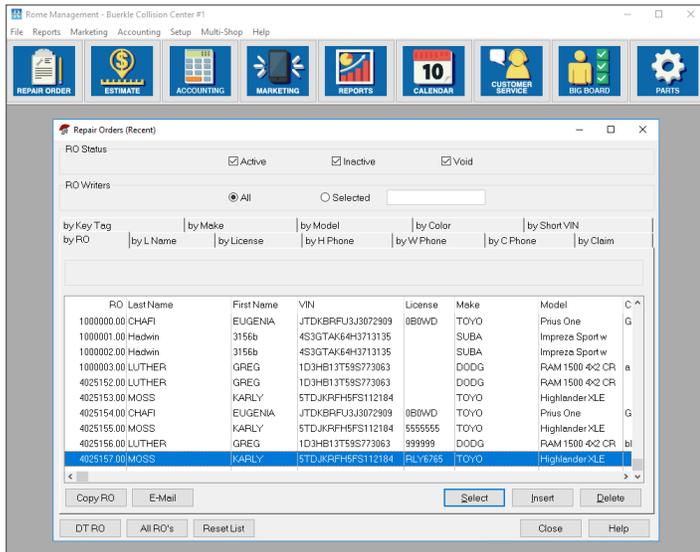

Figure 1

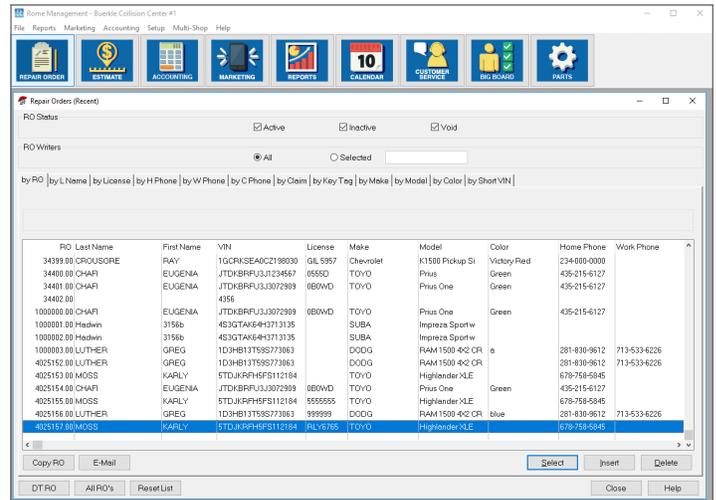

Figure 2

NOTE: The Calendar window has a minimum size limitation and can only be made larger. The RO detail display cannot be resized, but it can be moved to a preferred location on the remote desktop.

WINDOW POSITION:

Each primary window can be positioned to a preferred place on remote desktop and the program will then remember this position upon window closure or the next login. To move a window within the desktop, simply click and hold at the top header of the window and then click/hold, move and unclick at the desired location. In **Figure 3**, the RO list and calendar are displayed within the remote desktop side by side.

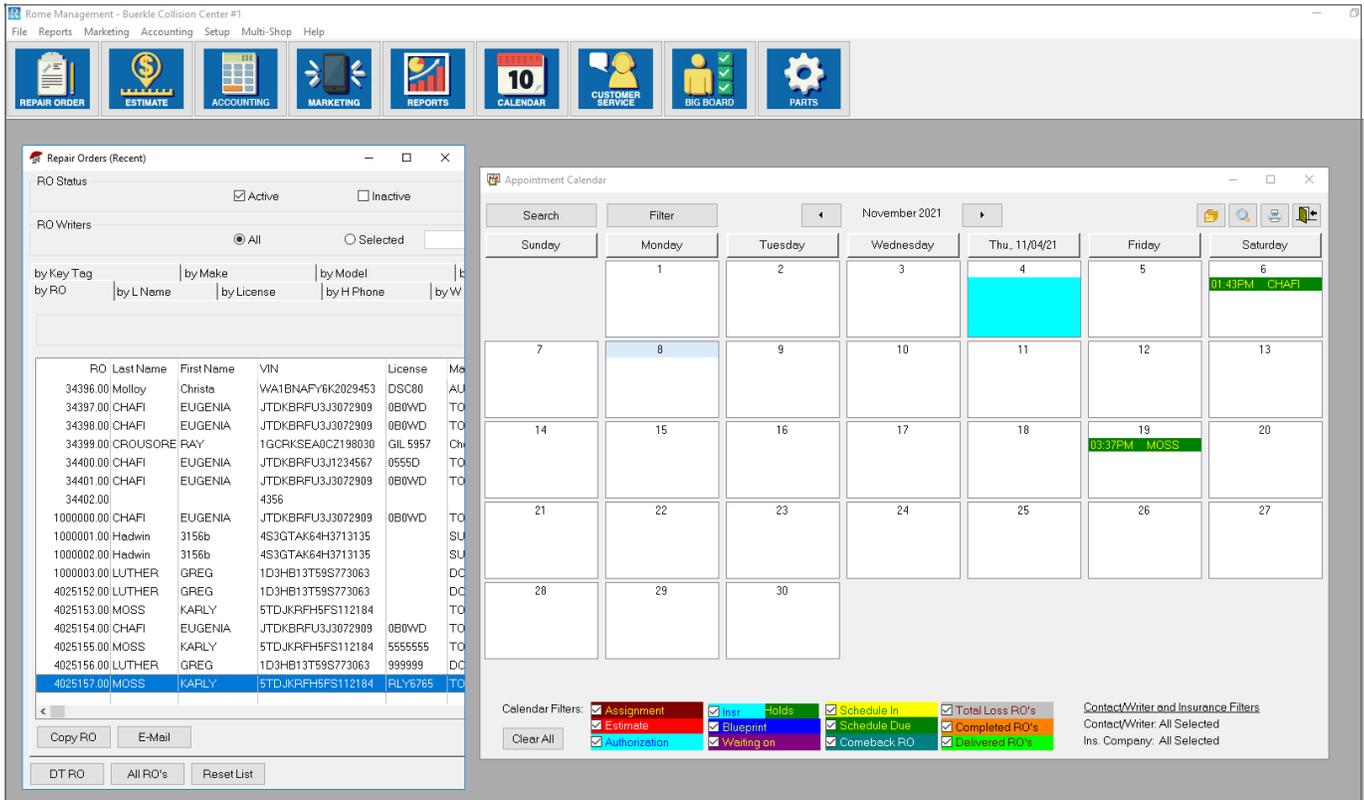

Figure 3

WINDOW COLUMN WIDTH:

Each primary window allows the user to change the individual column width and the program will remember this upon window exit or next login. To adjust the column width on a window, hover over the vertical edge of the column until the horizontal split-arrow icon appears, click/hold, move the width and then unclick. In **Figure 4** the column widths of the Recent RO window have been adjusted. The program will remember the column width changes and will restore the preferred view upon window closure or when the user logs in next.

WINDOW TAB PREFERENCE:

Each primary window allows the user to select the preferred sort-tab to be saved as the user's preferred display. In **Figure 5** the RO Notes Tab is displayed and the user has selected the "By Date" note sort preference. The program will remember this selection and upon window closure will display that preference for further RO Notes displayed and upon the next user login.
